Prepared for Capstone Project 1

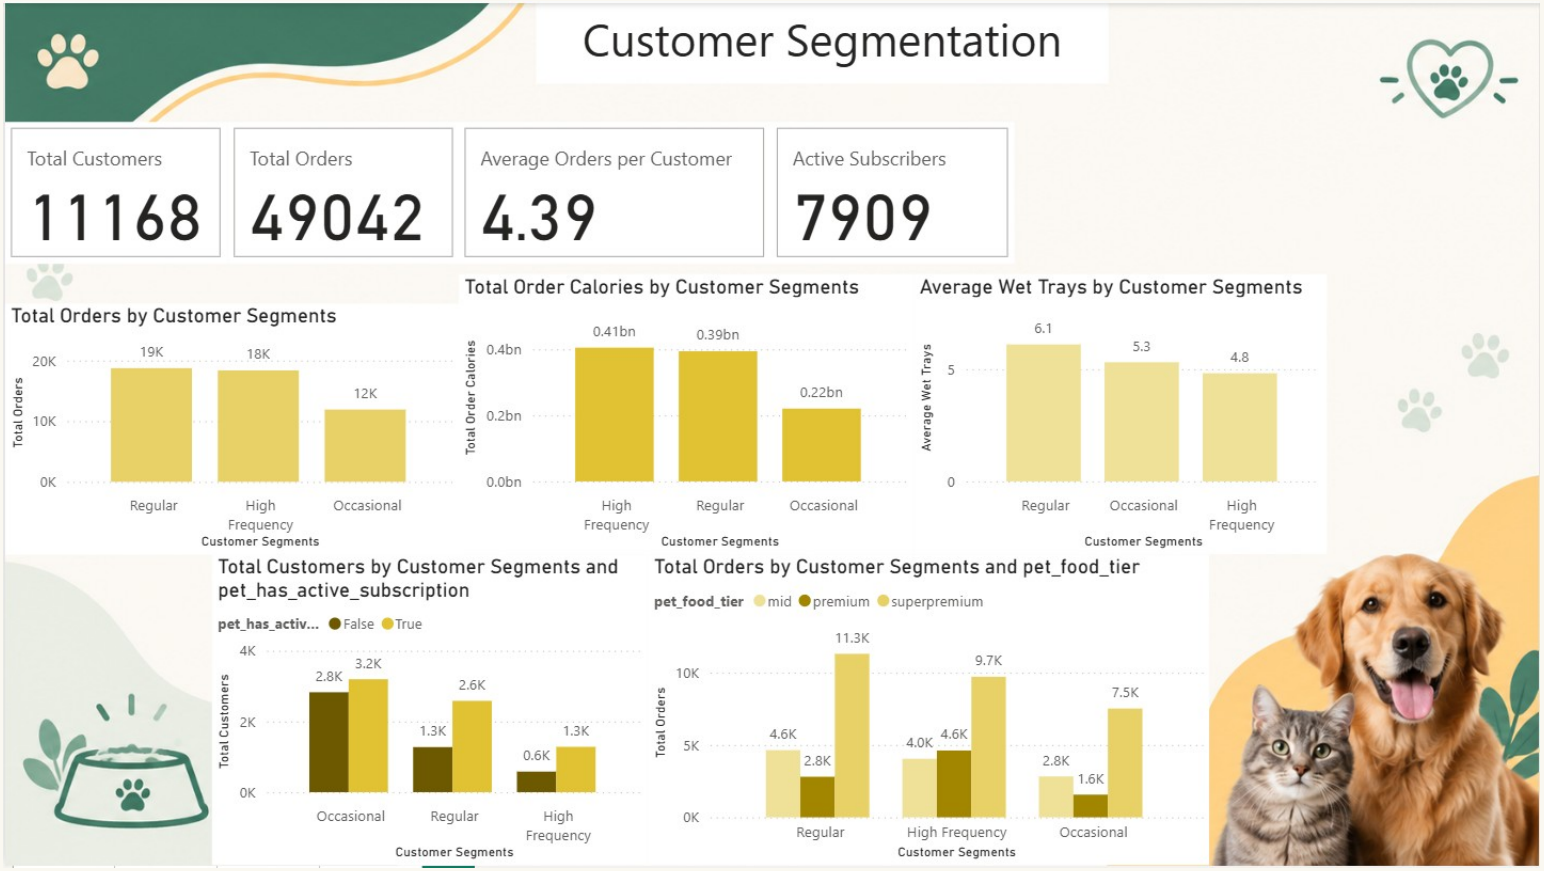

Dashboard Page 1 — Executive Overview

Executive insights

- The dataset contains 49,042 orders from 11,168 customers and 13,087 pets.
- 60.43% of pets shown in the dashboard have an active subscription, indicating a substantial recurring-order base.
- Mature life-stage orders dominate volume at about 29.1K orders.
- Superpremium food accounts for 58.18% of orders, followed by mid-tier at 23.49% and premium at 18.34%.
- Order activity rises substantially through 2019 and remains elevated into early 2020.

Dashboard Page 3 — Customer Segmentation

Customer behaviour insights

- Average orders per customer are 4.39.
- Rule-based segments divide customers into Occasional (1–3 orders), Regular (4–7), and High Frequency (8+).
- Regular and High Frequency segments contribute similar order volumes (~19K and ~18K respectively), while Occasional contributes ~12K.
- High Frequency customers generate about 0.41bn total order calories, slightly above Regular customers (~0.39bn).
- Regular customers have the highest average wet-tray quantity (~6.1), while High Frequency averages ~4.8.

Cross-Dashboard Insights

What the four pages tell us together

1 Demand is concentrated in mature life stage

Mature represents about 29.1K of 49.0K orders, making it the largest demand group. It also drives the largest total calorie demand and aggregate digital activity.

2 Premium positioning is visible in order mix

Superpremium accounts for 58.18% of orders. It also has the highest average wet-tray quantity among the three food tiers.

3 Recurring behaviour is substantial

The dashboard reports 60.43% active subscription coverage and an average of 4.39 orders per customer, indicating meaningful repeat-order behaviour.

4 Frequency segmentation adds a customer lens

Regular and High Frequency customers together account for most observed orders. High Frequency customers also contribute the highest aggregate calorie demand.

5 Life stage matters more for calories than engagement

The statistical analysis found a stronger practical effect for life stage on total order calories than on website minutes since the last order.

6 Volume and engagement must be separated

Several engagement visuals use aggregate totals. High totals can reflect a larger group size, so per-customer or per-order averages are preferable for direct behavioural comparisons.
